# Introduction

Today, testing and accountability, instead of curriculum and instruction, have taken center stage in schools and classrooms across the country. As more accountability provisions are piled on schools, staff and students, attention has shifted away from what kids should be learning, and moved toward test scores and their implications. However, what seems to have been forgotten is that student achievement and test scores are a reflection of what is taught in the classroom.

The AFT has long been an advocate for common, coherent content standards, which ensure that all children, regardless of neighborhood, are exposed to rich, well-sequenced content and skills, starting in kindergarten or before. We know that shallow, overly broad standards fail to address students' basic skills, but it is also clear that increased assessment requirements have squeezed music, the arts, history and other nontested subjects out of the curriculum. Now, more than ever, states must develop common, coherent, grade-by-grade standards.

**Common, coherent, grade-by-grade standards are an important professional tool.**

When standards are neither too vague nor overly prescriptive, they enhance teaching and learning. Common, coherent standards:

- Allow teachers and parents to get a good sense of what students are expected to know and be able to do at any specific grade level.
- Help teachers identify which students are having difficulty and need extra help.
- Allow teachers to develop, share and refine best practices with their colleagues, and ensure that professional development is based on what teachers actually teach, not pedagogical fads.
- Ensure that transient students won't suffer from a new curriculum every time they switch schools.
- Guarantee that all students are exposed systematically to the knowledge and skills they need, without risking unproductive repetition or lack of exposure to key topics.
- Enable teachers to prepare their students for state assessments without drill and kill.

**Common, coherent, grade-by-grade standards promote effective professional development opportunities.** Research strongly suggests that when professional development is pegged to the standards and curriculum being taught (instead of geared toward generic skills), it is more effective—and the effects are seen in student achievement. Plus, a shared understanding of what students should know and be able to do enables the best kind of professional development: collegial efforts to share best practices and to overcome common teaching challenges.

Since 1995, the American Federation of Teachers has judged state content standards on their clarity and specificity. We continue that tradition with our latest review of state efforts to develop rich, common, coherent standards in the four core content areas (English, math, science and social studies).

# What We Looked For

In brief, content standards are at the heart of a coherent standards-based education system. They define our expectations for what’s important for children to learn, serve as guideposts for curriculum and instruction, and should be the basis of all assessments—whether formal, informal, state-developed or teacher-created. These state-developed public documents are consulted by teachers, parents and the general public when they want to understand content-matter expectations.

Content standards should exist for every single grade, kindergarten through high school, in every subject. Grade-by-grade content standards increase the likelihood that all students are exposed to a rigorous, sequenced curriculum that is consistent across grades, schools and school districts. Grade-specific standards also facilitate greater alignment of standards-based curriculum, assessments, textbooks, professional development and instruction. States that organize their standards grade by grade are best able to specify what students should learn and when they should learn it. Unfortunately, the quality of content standards varies enormously from state to state, subject to subject and grade to grade. Standards can be full of empty rhetoric, unclear and devoid of content. They can be so vast and scattered that no teacher could prepare a student to meet them in the course of a school year. If they are too vague, teachers and test developers can’t hope to focus on the same materials. If they are too narrow, they constrict the curriculum. If they are too long and/or fail to make priorities clear, teachers end up in a guessing game as to what to teach—and test developers end up guessing what to assess. The quality of content standards matters greatly to the inter-related functions of teaching and learning, as well as to the fairness of tests and the accountability systems they support.

## The Criteria

We examined each state’s and Washington, D.C.’s content standards documents to determine whether or not they contain enough information about what students should learn to provide the basis for coherent curricula and assessments. There is no perfect formula for this; we made a series of judgment calls based on a set of criteria. To be judged “strong,” a state’s content standards must:

- Be detailed and explicit with little or no repetition, and rooted firmly enough in the content of the subject area to lead to a common, knowledge-rich curriculum.
- Contain particular content:
  - English standards must cover reading basics (e.g., word attack skills, vocabulary), reading comprehension (e.g., exposure to a variety of literary genres), writing conventions (e.g., spelling, writing mechanics) and writing forms (e.g., narrative, persuasive, expository).
  - Math standards must cover number sense and operations, measurement, geometry, data analysis and probability, and algebra and functions.
  - Science standards must cover earth, physical and life sciences.
  - Social studies standards must cover specific content in U.S. history, world history and civics.
- Provide attention to both content and skills.
- Be articulated for every grade from K-8 and by grade or course at the high school level.

In general, strong content standards provide clear guidance to teachers, curriculum and assessment developers, textbook publishers and others, so that one person's interpretation of the central knowledge and skills students should learn at a particular grade will be comparable to someone else's. Table 1 presents examples of state standards that meet and do not meet the AFT's criteria.

### What We Examined

We examined only those documents that states posted on their Web sites as of October 2007 and referred to as the state content standards (see Appendix B). In our findings, we report on each state's standards by level (i.e., elementary, middle and high school). To be judged as having strong content standards at any particular level, a state had to meet our criteria for strong content standards in more than half of the grades associated with that level. In order to have strong elementary standards, at least four of the six grades (grades K-5) had to meet the AFT criteria; at the middle level (grades 6-8), at least two grades had to meet our criteria; and at the high school level (grades 9-12), more than 50 percent of the required standards/courses needed for graduation had to meet our criteria.

**Table 1: Examples of strong and weak content standards**

	STRONG STANDARDS	WEAK STANDARDS
ENGLISH	Distinguish between cause and effect and between fact and opinion in informational text. Example: In reading an article about how Snowshoe rabbits change color, distinguish facts (such as <i>Snowshoe rabbits change color from brown to white in the winter</i> ) from opinions (such as <i>Snowshoe rabbits are very pretty animals because they can change colors</i> ). (Grade 4)	Demonstrate the understanding that the purposes of experiencing literary works include personal satisfaction and development of lifelong literature appreciation. (Grade 4)
MATH	Understand how real and complex numbers are related, including plotting complex numbers as points in the plane. Example: Plot the points corresponding to $3-2i$ and $1+4i$ . Add these complex numbers and plot the result. How is this point related to the other two? (Algebra II)	Model and analyze real-world situations by using patterns and functions. (Grades 9-12)
SCIENCE	Describe how groups of elements can be classified based on similar properties, including highly reactive metals, less reactive metals, highly reactive nonmetals, less reactive nonmetals, and some almost completely nonreactive gases. (Grade 8)	Describe the historical and cultural conditions at the time of an invention or discovery, and analyze the societal impacts of that invention. (Grades 5-8)
SOCIAL STUDIES	Evaluate the significance of the presidential and congressional election of 1800 and the transfer of political authority and power to the Democratic-Republican party led by the new president, Thomas Jefferson (1801). (Grade 8)	Identify significant events and people and important democratic values (e.g., freedom, equality, privacy) in the major eras/civilizations of state, American Indian, United States, and world history. (Grade 8)

# What We Found

Only one state, Virginia, meets the AFT criteria for strong standards in all levels and subjects. While some states have a lot of work ahead of them, others only have to focus on a few grades in one subject area (see Table 2). For a breakdown of how each state did in our review, see Appendix A.

Percentage	States
0%	Colorado, Illinois, Iowa, Montana, Nebraska, Pennsylvania, Wisconsin
1-24%	Maine, New Hampshire, New Jersey, Rhode Island, Vermont, Wyoming
25-49%	Alaska, Idaho, Kansas, Kentucky, Minnesota, Nevada, Oregon, Washington
50-74%	Arizona, Connecticut, Delaware, Florida, Hawaii, Maryland, Massachusetts, Mississippi, Missouri, New Mexico, North Dakota, South Dakota, Texas, Utah
75-99%	Alabama, Arkansas, California, Georgia, Indiana, Louisiana, Michigan, New York, North Carolina, Ohio, Oklahoma, South Carolina, Tennessee, Washington, D.C., West Virginia
100%	Virginia

**States continue to do a better job with their math and science standards.** Since the AFT's first review of standards in 1995, states have consistently done a better job developing strong math and science standards than English or social studies standards. In our current review, 24 states have strong math standards and 22 have strong science standards. However, only eight states have strong English standards at all levels, and only two states have strong social studies standards at all levels (see Table 3).

Subject Area	States
ENGLISH	Georgia, Indiana, New Mexico, New York, North Carolina, Tennessee, Virginia, Washington, D.C.
MATH	Alabama, Alaska, Arkansas, California, Delaware, Florida, Georgia, Hawaii, Idaho, Indiana, Louisiana, Maryland, Mississippi, New York, North Carolina, Ohio, Oklahoma, South Carolina, South Dakota, Texas, Utah, Virginia, Washington, D.C., West Virginia
SCIENCE	Alabama, Arkansas, California, Connecticut, Delaware, Georgia, Hawaii, Indiana, Louisiana, Maryland, Michigan, Mississippi, Missouri, North Carolina, Ohio, Oklahoma, South Carolina, South Dakota, Tennessee, Virginia, Washington, D.C., West Virginia
SOCIAL STUDIES	Massachusetts, Virginia

**The quality of the standards also varies by level.** When we took a closer look at the standards, we found that for most subjects, the middle level standards are the strongest, while the high school level standards are the weakest (see Table 4). The weaknesses at the high school level are, in many cases, due to the high school standards being clustered (e.g., one set of standards for grades 9-12) instead of being grade- or course-specific.

<b>Table 4: Percentage of clear, specific, content-rich standards by school level</b>			
	<b>% OF ELEMENTARY LEVEL STANDARDS THAT ARE STRONG</b>	<b>% OF MIDDLE LEVEL STANDARDS THAT ARE STRONG</b>	<b>% OF HIGH SCHOOL LEVEL STANDARDS THAT ARE STRONG</b>
ENGLISH	47	31	25
MATH	78	84	47
SCIENCE	53	63	53
SOCIAL STUDIES	6	45	43

**Standards that failed to meet our criteria did so for three main reasons: They were repeated, clustered, or had missing or vague content.** All three of these problems have the same, terrible consequences: Teachers do not have a common understanding of what students should have learned in the previous grade, what they are expected to master in the current grade, or what they are preparing them to learn in the following grade. (This problem can extend to textbook writers, professional development providers and assessment developers as well.)

So how do the failing standards break out? A number of states received poor ratings for their **English** standards because of significant repetition from grade to grade. Thirty-five percent of elementary school English standards (grades K-5), 41 percent of middle school English standards (grades 6-8) and 24 percent of high school English standards (grades 9-12) simply repeat more than 50 percent of their standards from grade to grade. Repeated standards have the same problem as clustered standards: Teachers have no clear understanding of what students should have learned, are learning, and will be learning.

More than three-quarters (78 percent) of **math** standards that did not meet our criteria were clustered; an additional 13 percent simply repeated the same standards from grade to grade and 9 percent were vague.

The vast majority of science standards that did not meet our criteria had clustered standards: 87 percent of science failures were due to clustered standards; an additional 10 percent were due to missing or vague content.

In social studies, the failures were more evenly distributed between clustering and missing or vague content: 58 percent of social studies failures were due to the standards being clustered; 39 percent of failures were due to missing or vague content.

Through our analysis we also found that too many states have clustered K-2 standards or have chosen not to write them at all. In fact, *nine states have clustered or no standards for K-2 in the crucial areas of literacy and numeracy.* This is a serious problem that states must address because specific, coherent, grade-by-grade standards at the early grades are essential to building students' background knowledge and vocabulary. They can help ensure that all kids enter middle school ready to comprehend challenging material. Knowledge-rich K-2 standards are especially vital for children from low-income families who, on average, have been exposed to roughly 30 million fewer words than children from professional families—and whose “word and world knowledge” is, therefore, substantially less than that of their peers.

# What States Should Do

- **Develop grade-by-grade standards that are explicit.** Too many states only write standards for those grades and subjects that are assessed by the state. Yes, state tests must reflect the content found in the standards. But as any teacher or student can attest, there is more to teaching and learning than the state test. In addition, tests are not measuring the knowledge gained in any single grade. Knowledge is cumulative. For students to do well on the fourth-grade math test, for example, they had to have mastered certain content and skills in grades K-3. Clearly, the existence of standards should not be contingent on a state test. Instead, it is imperative that administrators, teachers, parents and students know what all students should be learning, regardless of how—or even if—the content and skills are measured by a state assessment.
- **Bring specific United States and world history into their early elementary standards.** Currently, only three states bring specific United States and world history into their early elementary standards (Arizona, Massachusetts and Virginia). Most states wait to bring in U.S. history specifically at grade 4 and world history specifically at grade 5. And, in too many instances, world history is included in the context of U.S. history only. Ultimately, this means students learn about other nations through U.S. exploration (e.g., Christopher Columbus and Spain) or through conflicts (e.g., Japan’s role in World War II, U.S. and Vietnam during the Vietnam War). This practice is most prevalent at the elementary level; however, a few states also do this at the middle and high school levels.
- **Describe what high school students should know and be able to do by course.** The reality of high school is that students enroll in courses, not grade-specific subjects. In other words, students are enrolling in U.S. History from 1877 and not in Social Studies 11. Standards should reflect the reality of how high schools function. States that have grade-by-grade high school standards have made a positive first step in defining what high school students should learn. But those grade-by-grade standards are not comparable to the coursework high school students are taking, and are, therefore, of little use to teachers, professional development providers, textbook writers and assessment designers.

In addition, too many high school standards are clustered, meaning one set of standards applies to more than one grade (e.g., grades 9-10, 9-11, or even 9-12). Forty-seven percent of high school English and math standards, and 45 percent of high school science and social studies standards are clustered. In these states, there is no clear understanding of what students are expected to learn throughout their high school years.

Finally, too many states have graduation requirements that don’t complement or reflect their standards. For example, a state may require Algebra I to graduate from high school, but may not have Algebra I standards. Or, a state may require four years of English, but only provide one set of standards to cover all grades 9-12.

- **Provide instructional guidance and teacher resources to help teachers bring the standards into the classroom.** It isn’t enough to develop a strong set of standards.

There must be an understanding of what the standards mean, and the concepts and skills necessary for students to demonstrate mastery of them. Teachers should have access to detailed guides that explain the content to be taught, offer ideas for how to present the material to students, show sample student responses that demonstrate differing levels of performance on the standards and include sample classroom assessments. Such guides would be helpful not only to teachers, but also to teacher preparation organizations, professional development providers, textbook writers and state assessment developers.

By addressing these four areas, we believe that states can strengthen their standards and make them more meaningful to teachers, students, curriculum developers, test designers, textbook writers and professional development providers. The good news is that states don't have to start from scratch. Instead they can learn from each other. Table 5 lists those states with what we've identified as "model" standards in each of the four core areas we reviewed and at various grade levels. These standards are clear, specific and grounded in content, and would be a useful reference for any state looking to strengthen their own standards. Finally, we've also identified standards documents that include more elaboration or instructional guidance to help teachers deliver the standards in their classrooms.

A strong education system must begin with strong standards. However, it is important to remember that standards alone—no matter how strong—do not provide the common ground that educators and students need. An effective education system must include curricula and assessments aligned to the standards, professional development for teachers, help for children struggling to meet the standards and policies that make meeting the standards count. States also need to develop all of these components in an ordered and systemic fashion. Imposing consequences without having an aligned curriculum, teacher preparation and adequate resources is a sure recipe for disaster. Administering tests disconnected from a state's standards and curriculum can only lead to student failure and widespread discontent, potentially undermining support for public education.

Ultimately, state officials must ask themselves: Do students in district X cover the same content and skills, at the same depth of understanding, as students in district Y?

<b>Table 5: Model standards documents</b>	
SUBJECT	STATE
English—K-12	Indiana
Math—K-12	Indiana, Ohio
Science—K-12	Delaware, Ohio
Science—High School	Indiana, Michigan
Science—High School Biology	Arkansas
Social Studies—K-5	Arizona
Social Studies—High School	Indiana, Massachusetts
Clarifying Language & Instructional Guidance	South Dakota (Math and Science), Utah (Math)

If the answer is “no” or “I don’t know,” then more work is needed to ensure that all students—regardless of socioeconomic status or where they live in the state—are given opportunities to learn and ultimately master the content standards. This process must start with strong content standards that reflect the qualities discussed throughout this brief.

If we want students to have a deeper understanding of important topics, then we need to ensure that they have opportunities in the classroom to delve deeper into various concepts and skills. This is not possible in the current environment, which requires teachers to spend endless hours on test preparation and teaching-to-the-test activities. Now more than ever, the need for common, content-rich standards has become essential.
